ABSTRACT

When a retrieval keyword that requires contents is transmitted to a server, the server retrieves contents from a database based on the retrieval keyword, and generates page information including retrieved list information of contents, and appending information that displays whether or not the page information is provided with a consecutive reproduction function of making a terminal device consecutively reproduce part of contents included in the list information respectively to the page information, and transmits the page information. The terminal device displays a list of contents (tunes) on a display unit [[173]]based on the page information, and displays an icon [[174]]in case the list is provided with the consecutive reproduction function to demonstrate that the consecutive reproduction is possible.
